A T A G

# ERSITY

The number and variety of animal, plant, microbial and other species which inhabit the earth, the genetic variation within them as well as the differences in the places they live.

The evolutionary processes through which all species have arrived at their current shape, size, colour and form, as well as those changes engineered by us.

The manner in which we, the human species, interact with all other species and their habitats, will largely determine the future for all of us.
