Wet season bed-material particle size distribution and statistics for Swift Creek (Ngarradj) catchment between 1998 and 2002

MJ Saynor, BL Smith & WD Erskine

1 Introduction

Erskine et al (2001) proposed that a sediment budget framework should be adopted by the Environmental Research Institute of the Supervising Scientist (*eriss*) to assess the physical impacts, if any, of the Jabiluka project on the Ngarradj catchment (fig 1). Thirteen projects were outlined by Erskine et al (2001) to form the basis of this assessment including, among other things, the systematic sampling of bed-material load on the project catchment channels and Swift Creek (fig 1). Bed-material load is the coarser part of the total sediment load that is composed of particles found in the bed material in appreciable quantities and that is transported at a rate dependent on stream discharge (Einstein et al 1940).

During each wet season, the various grain size fractions of the bed material of Ngarradj and its tributaries are reworked and transported downstream at various rates to a number of sediment storages. Detailed bed-material load measurements at each *eriss* river gauging station were made during wet season flows, to determine sediment flux and particle size using the methods described by Saynor et al (2001).

This Internal Report presents the bed-material load particle size data collected at each of the three *eriss* gauging stations during the wet seasons, 1998/1999 to 2001/2002, inclusive.

Analysis of the bed-material load transport rates will be presented in a subsequent Supervising Scientist Report. The data contained in this internal report complements that obtained from the bulk bed-material samples collected during each dry season between 1998 and 2003 (Saynor et al 2004, 2005) and the bed-material at the scour chain sites in Ngarradj (Erskine et al 2003).

2 Methods

The three *eriss* gauging stations in the Ngarradj catchment were visited weekly during periods of streamflow for the wet seasons of 1998/1999 to 2001/2002 inclusive. During each visit the gauging station data were downloaded and a number of other parameters collected. One of these parameters included the collection of bed-material load samples using a Helley-Smith bedload sampler (Helley & Smith 1971).

2.1 Field Methods

The Helley-Smith pressure difference bedload sampler used for this work (Helley & Smith 1971) was designed to be compatible with depth integrated suspended sediment samplers and is one of the most accurate bedload samplers yet designed (Emmett 1979). The orifice diameter of the Helley-Smith sampler closely approximates the unsampled zone between the intake nozzle and the bed of a depth integrated suspended sediment sampler (Helley & Smith

1971). The Helleys-Smith sampler has been used within the Alligator Rivers Region in Magela Creek to collect bed-material samples (Roberts 1991, Jansen & Nanson 2004). Figure 2 shows bedload samples being collected at the Swift Creek gauge site.

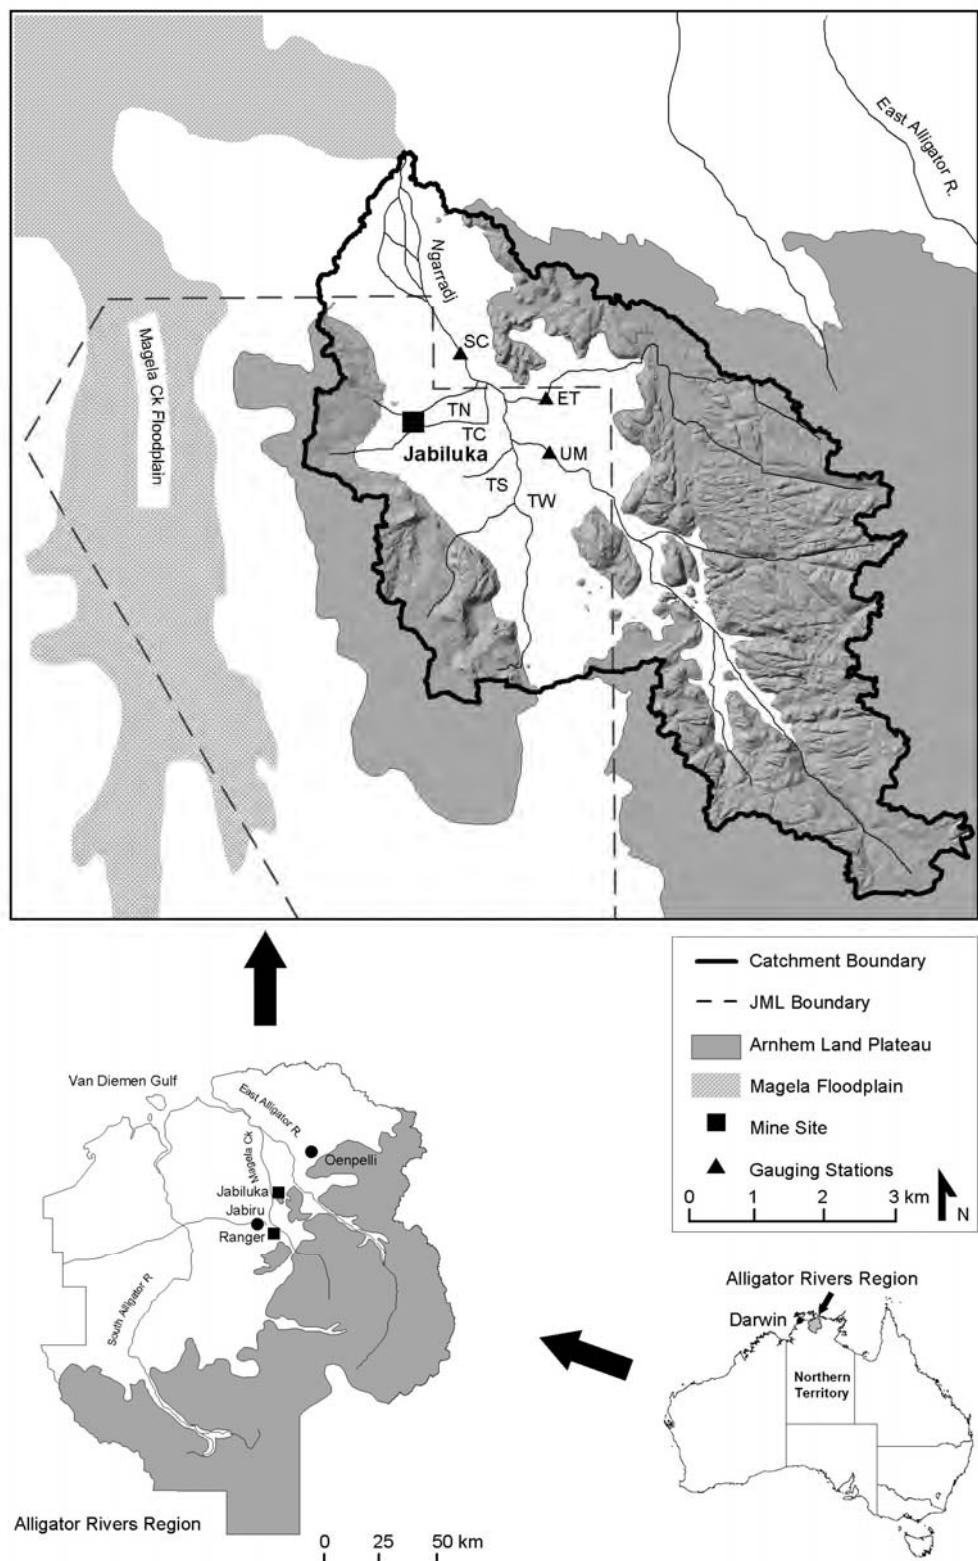

Figure 1 The Ngarradj catchment showing the location of the Jabiluka Mineral Lease (JML), *eriss's* gauging stations and local creek names. SC refers to Swift Creek gauging station, TN Tributary North, ET East Tributary gauging station, TC Tributary Central, TS Tributary South, TW Tributary West and UM upper Swift Creek gauging station

Field methods followed those used by the Water Resources Division of the United States Geological Survey and have been outlined by Carey (1984, 1985), among others. At least 4 but usually 6 point measurements of bedload transport were taken at each gauging station cross section. Measurement times were determined on a trial and error basis and were generally 3–5 minutes for high streamflows and 10 minutes for lower flows. Each bed-material load gauging consisted of a double pass across each cross section (ie 8, 10 or 12 point measurements). Although instantaneous bed-material load fluxes are highly variable, it is usually possible to define a mean flux for a given discharge, provided sufficient thorough field measurements are made (Carey 1985).

In the field, each bed-material load sample was carefully washed (using a squeeze bottle filled with creek water) into a labelled plastic bag and then sealed and placed in a box for the trip back to the laboratory.

2.2 Laboratory methods

Each individual bed-material load sample was oven dried at 105°C for 24 hours before being weighed and then subjected to particle size analysis (PSA). For the 1998-1999 wet season each individual sample was subjected to particle size analysis. In subsequent years after the individual weights had been recorded the samples belonging to each transect were combined into transects, so that for each date at each site there were 2 samples only subjected to PSA, (transect 1 comprised the samples collected on the first pass across the cross section and transect 2 comprised the samples collected on the same cross section on the return pass).

As the sieve size of the mesh on the bag of the Helley-Smith sampler was 0.063 mm, there was very little clay present in samples and hence the samples did not need to be chemically or physically dispersed. Saynor et al (2005) also found that there was a very small percentage of sediment finer than 0.063 mm in the bed-material samples collected at the permanently monumented cross sections at each *eriss* gauging station. When a gravel fraction was present the sample was manually sieved in its entirety at $\phi/2$ intervals. If the sand fraction was greater than 150 g it was passed through a riffle box to obtain a sub-sample of approximately 100 g to ensure that the stainless steel sieves were not damaged by excessive loading. The split sand sample was then poured into a nest of sieve meshes separated by $\phi/2$ intervals to bracket the particle size range and the assembly placed on an automatic shaker for 15 minutes. The samples retained on each sieve were weighed on a two decimal place balance with the weights recorded as cumulative mass. This enabled cumulative frequency percentages to be calculated. The sediment masses were then entered into a spreadsheet and grain size statistics calculated, as outlined below.

The phi (ϕ) notation system is often used to describe the grain size of clastic sediment by sedimentologists. It is a logarithmic scale in which each grade limit is twice as large as the next smaller grade limit (Folk 1974, 1980) and is denoted by:

$$\phi = -\log_2 d \quad (1)$$

where d is the grain diameter in mm.

Figure 2 Bedload samples being collected at the Swift Creek site. Where possible two samplers were used to collect samples on each transect, thus reducing collection time.

2.3 Grain size statistics

Graphic grain size statistics (ie graphic mean size, inclusive graphic standard deviation, inclusive graphic skewness, graphic kurtosis and transformed kurtosis) were calculated in Excel spreadsheets using the equations of Folk and Ward (1957) and Folk (1974, 1980). These equations are outlined below and only use, at most, 90 % of the grain size distribution between the 5th and 95th percentiles (Folk 1974, 1980). Nevertheless, such graphic measures are preferred to the method of moments, which weights equally all grain size fractions. This assumption (i.e. equal weighting) is unjustified because there are major problems in accurately determining both the coarsest and finest fractions of the grain size distribution. Very large sample masses are required to reliably estimate the coarsest percentiles. Furthermore, there are methodological problems in accurately measuring the clay fraction, especially when present in relatively small amounts, such as for the present samples (Gee & Bauder 1986).

The equations used to calculate the graphic grain size statistics (Folk & Ward 1957, Folk 1974, 1980) are:

$$M_z = (\phi_{16} + \phi_{50} + \phi_{84}) / 3 \quad (2)$$

where M_z is graphic mean size in ϕ units and ϕn is the phi (ϕ) value corresponding to the n^{th} percentile, (eg $\phi 16$ is the ϕ value corresponding to the 16th percentile)

$$\sigma_I = (\phi 84 - \phi 16) / 4 + (\phi 95 - \phi 5) / 6.6 \quad (3)$$

where σ_I is inclusive graphic standard deviation and $\phi 84$ is as defined above.

$$Sk_I = ((\phi 16 + \phi 84) - 2 \times \phi 50) / 2 \times (\phi 84 - \phi 16) + ((\phi 5 + \phi 95) - 2 \times \phi 50) / 2 \times (\phi 95 - \phi 5) \quad (4)$$

where Sk_I is inclusive graphic skewness and $\phi 16$ is as defined above.

$$K_G = (\phi 95 - \phi 5) / (2.44 \times (\phi 75 - \phi 25)) \quad (5)$$

where K_G is graphic kurtosis and $\phi 95$ is as defined above.

$$K'_G = K_G / (1 + K_G) \quad (6)$$

where K'_G is transformed kurtosis.

The meanings of the graphic grain size statistics and the verbal scales of Folk (1974, 1980) to describe these statistics are briefly outlined below. The Wentworth grain size scale for sediments is used throughout this report and is given in Table 1. **Graphic mean size** is a reliable estimate of the mean and is expressed in terms of the Wentworth scale. **Inclusive graphic standard deviation** is a measure of sorting and is classified by the following qualitative scale:

- < 0.35 ϕ very well sorted;
- 0.35 – 0.50 ϕ well sorted;
- 0.50 – 0.71 ϕ moderately well sorted;
- 0.71 – 1.0 ϕ moderately sorted;
- 1.0 – 2.0 ϕ poorly sorted;
- 2.0 – 4.0 ϕ very poorly sorted;
- > 4.0 ϕ extremely poorly sorted.

Skewness is the degree of asymmetry of a grain size distribution. Positive skewness means an excess of fine sediment and vice versa. The more the inclusive graphic skewness value departs from 0 the greater the degree of asymmetry. The following qualitative scale is used:

- 0.30 – 1.0 strongly fine skewed;
- 0.10 – 0.30 fine skewed;
- 0.10 - -0.10 near symmetrical;
- 0.10 - -0.30 coarse skewed;
- 0.30 - -1.0 strongly coarse skewed.

Graphic kurtosis is the ratio between the sorting in the tails of the grain size distribution and the sorting in the central portion. If the central portion is better sorted than the tails, the curve is leptokurtic; if the tails are better sorted than the central portion, the curve is platykurtic. The following qualitative scale is used:

- < 0.67 very platykurtic;

0.67 – 0.90 platykurtic;
 0.90 – 1.11 mesokurtic;
 1.50 leptokurtic;
 1.50 – 3.00 very leptokurtic;
 3.00 extremely leptokurtic.

Transformed kurtosis is used to normalise the kurtosis distribution. Using transformed kurtosis a normal curve has a value of 0.50 and most sediments range between 0.40 and 0.65.

2.4 Sediment texture

The sediment textural classification used for bed-material load samples is that of Folk (1954, 1974, 1980) for unconsolidated materials and is based on a ternary diagram showing the proportions of gravel, sand and mud on separate axes (Figure 3). This texture triangle is split into 15 groups and the median diameter is determined, where possible, for each component fraction. Each sediment fraction can be expressed in terms of one of the Wentworth size classes (Table 1). To place a sample into one of the 15 major groups, only two properties need to be determined, namely the gravel percentage (boundaries at 80, 30, 5 and a trace or 0.01 %) and the ratio of sand to mud with boundaries at 9:1, 1:1 and 1:9 (Folk 1954, 1974, 1980). The gravel content is partly a function of the highest current velocity and the maximum grain size of the supplied sediment. The sand: mud ratio reflects the amount of winnowing (washing away of fine sediment) that has occurred. For samples lacking gravel, a further ternary diagram (Figure 4) is used which expands the bottom tier of Figure 3. It is based on the proportions of sand, silt and clay (see Folk 1954, 1974, 1980).

Table 1 The Wentworth grain size scale for sediments (after Folk 1974, 1980)

Finest Grain Size (mm)	Finest Grain Size (ϕ)	Wentworth Size Class
256	-8	Boulder
64	-6	Cobble
4	-2	Pebble
2	-1	Granule
1.00	0	Very coarse sand
0.50	1	Coarse sand
0.25	2	Medium sand
0.125	3	Fine sand
0.0625	4	Very fine sand
0.031	5	Coarse silt
0.0156	6	Medium silt
0.0078	7	Fine silt
0.0039	8	Very fine silt
0.00006	14	Clay

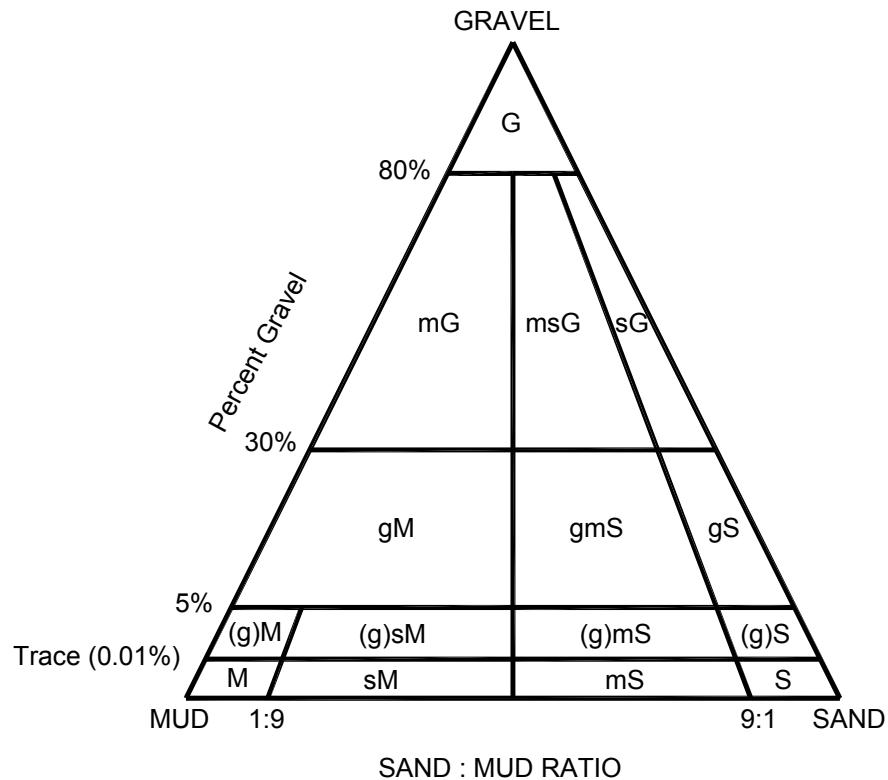

Figure 3 Folk's (1974, 1980) textural groups. G is gravel; sG sandy gravel; msG muddy sandy gravel; mG muddy gravel; gS gravelly sand; gmS gravelly muddy sand; gM gravelly mud; (g)S slightly gravelly sand; (g)mS slightly gravelly muddy sand; (g)sM slightly gravelly sandy mud; (g)M slightly gravelly mud; S sand; mS muddy sand; sM sandy mud; M mud.

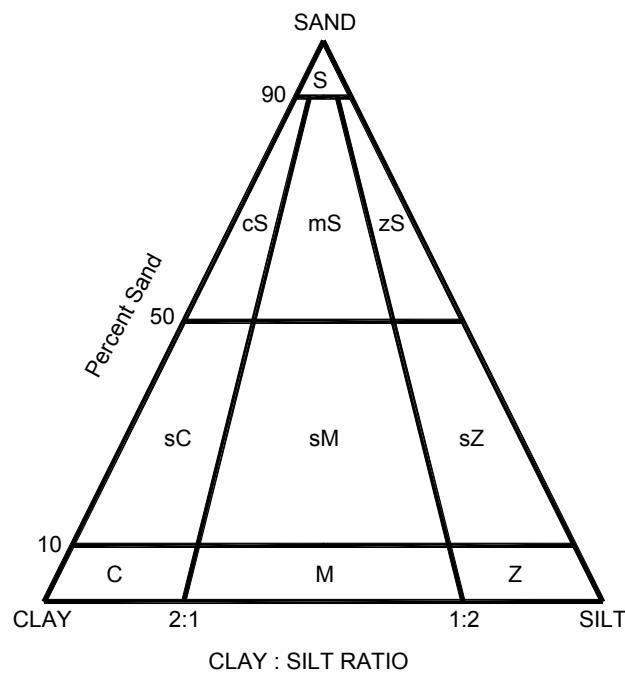

Figure 4 Folk's (1974, 1980) expansion of the bottom tier of Figure 3 to show textural classes for sediments lacking gravel. S is sand; zS silty sand; mS muddy sand; cS clayey sand; sZ sandy silt; sM sandy mud; sC sandy clay; Z silt; M mud; and C clay.

3 Results

The graphic grain size statistics for each bed-material load sample are listed in Appendix A. Table 2 shows the numbers of samples subjected to particle size analysis for the 1998/1999 to 2001/2002 wet seasons inclusive.

Table 2 Total number of bed-material load samples subjected to particle size analysis for the wet seasons 1998/1999 to 2001/2002 inclusive

Wet Season	East Tributary	Upper Swift Creek	Swift Creek	Total samples analysed each year
1998-1999	102	175	196	473
1999-2000	31	37	40	108
2000-2001	26	28	40	94
2001-2002	10	14	14	30
		Total samples analysed		713

3.1 1998/1999 wet season

A total of 473 samples were subjected to particle size analysis for the 1998/1999 wet season. For each sample, the grain size statistics were calculated, with the average value for each of the transects shown in Tables 3 to 5. The individual grain size statistics for each sample are shown in Appendix A. Cumulative percentage distributions are shown in Appendix B.

3.1.1 East Tributary 1998/1999 wet season samples

The grain size statistics for each bed-material load measurement transect are shown in Table 3.

Table 3 1998/1999 wet season grain size statistics at the East Tributary gauge

3.1.3 Swift Creek 1998/1999 wet season samples

The transects for the bed-material load samples at Swift Creek consisted of between 4 and 7 samples on each transect depending on the width of the sand boundary (the same number of samples were collected on transects for each date). The grain size statistics for each transect are shown in Table 5.

Table 5 1998/1999 wet season grain size statistics at the Swift Creek gauge

Date Sample Collected		Graphic Mean (Φ)	Graphic Standard Deviation (Φ)	Skewness	Graphic Kurtosis	Normal Kurtosis

3.2 1999/2000 wet season

A total of 108 samples were subjected to particle size analysis for the 1999/2000 wet season. For each transect, the grain size statistics are shown in Tables 6, 7 and 8. Cumulative masses and percentage distributions are shown in Appendix B.

3.2.1 East Tributary 1999/2000 wet season samples

The grain size statistics for the transects collected at East Tributary during the 1999/2000 wet season are shown in Table 6.

Table 6 1999/2000 wet season grain size statistics at the East Tributary gauge

3.5 Summary

Tables 15, 16 and 17 present summary values for each grain size statistic for each wet season at the three *eriss* gauging stations. At the East Tributary gauge, the bed-material load was coarsest during the 1998/1999 wet season. The other grain size statistics did not change during the measurement period. At the Upper Swift Creek gauge, there was a slight coarsening of the bed-material load after the 1999/2000 wet season but the other grain size statistics did not change during the measurement period. At the Swift Creek gauge, there was a slight coarsening of the bed-material load after the 2000/2001 wet season but the other grain size statistics did not change during the measurement period.

Table 15 Summary of annual bed-material load particle size statistics at the East Tributary gauge

4 Further work

This report contains the cumulative frequency grain size distribution data and grain size statistics for the bed-material load samples collected by the Helleys-Smith pressure difference sampler at each of the *eriss* gauging stations during the 1998/1999 to 2001/2002 wet seasons inclusive. This report is a data repository and the results will be used to produce a Supervising Scientist report on bed-material load fluxes.

5 Acknowledgments

For their assistance with the field work, processing some of the samples and inputting data to Excel spreadsheets we thank Gary Fox, Michael Grabham, Elice Crisp and Xavier Finlayson. We also thank Guy Boggs and Ken Evans for helping with the field work. Ann Webb greatly assisted with the finalisation of the report.

Appendix A Particle size statistics for the individual bed-material load samples collected during the 1998/1999 wet season

This appendix contains the particle size statistics for the individual bed-material load samples collected during the 1998/1999 wet season. The particle size statistics for the 1999/2000, 2000/2001 and 2001/2002 wet seasons are contained in the text. The cumulative particle size distributions are shown in Appendix B.

Appendix B East Tributary cumulative frequency data for bed-material load samples for the 1998/1999 wet season

This appendix contains the cumulative percentage values for the bed-material load samples collected at East Tributary for the 1998/1999 Wet season. All samples were dry sieved through a nest of sieves to a value of 4 phi (63 µm).

Table B1 Cumulative frequency data for bed material flux samples in East Tributary for 5 January 1999

Appendix C Upper Swift Creek cumulative frequency data for bed-material load samples for the 1998/1999 wet season

This appendix contains the cumulative percentage values for the bed-material load samples collected at Upper Swift Creek for the 1998/1999 Wet season. All samples were dry sieved through a nest of sieves to a value of 4 phi ($63 \mu\text{m}$).

Appendix D Swift Creek cumulative frequency data for bed-material load samples for the 1998/1999 wet season

This appendix contains the cumulative percentage values for the bed-material load samples collected at Swift Creek for the 1998/1999 Wet season. All samples were dry sieved through a nest of sieves to a value of 4 phi (63 μm).

Table D1 Cumulative frequency data for bed material flux samples in Swift Creek for 15 December 1998

Appendix E East Tributary cumulative frequency data bed-material load samples for the 1999-2000 wet season

This appendix contains the cumulative percentage values for the bed-material load samples collected at East Tributary for the 1999/2000 Wet season. All samples were dry sieved through a nest of sieves to a value of 4 phi (63 µm).

Appendix F Upper Swift Creek cumulative frequency data bed-material load samples for the 1999-2000 wet season

This appendix contains the cumulative percentage values for the bed-material load samples collected at Upper Swift Creek for the 1999/2000 Wet season. All samples were dry sieved through a nest of sieves to a value of 4 phi (63 µm).

Appendix G Swift Creek cumulative frequency data bed-material load samples for the 1999–2000 wet season

This appendix contains the cumulative percentage values for the bed-material load samples collected at Swift Creek for the 1999/2000 Wet season. All samples were dry sieved through a nest of sieves to a value of 4 phi ($63\text{ }\mu\text{m}$).

Appendix H East Tributary cumulative frequency data bed-material load samples for the 2000–2001 wet season

This appendix contains the cumulative percentage values for the bed-material load samples collected at East Tributary for the 2000/2001 Wet season. All samples were dry sieved through a nest of sieves to a value of 4 phi ($63 \mu\text{m}$).

Appendix I Upper Swift Creek cumulative frequency data bed-material load samples for the 2000–2001 wet season

This appendix contains the cumulative percentage values for the bed-material load samples collected at Upper Swift Creek for the 2000/2001 Wet season. All samples were dry sieved through a nest of sieves to a value of 4 phi ($63 \mu\text{m}$).

Appendix J Swift Creek cumulative frequency data bed-material load samples for the 2000–2001 wet season

This appendix contains the cumulative percentage values for the bed-material load samples collected at Swift Creek for the 2000/2001 Wet season. All samples were dry sieved through a nest of sieves to a value of 4 phi ($63\text{ }\mu\text{m}$).

Appendix K East Tributary cumulative frequency data bed-material load samples for the 2001–2002 wet season

This appendix contains the cumulative percentage values for the bed-material load samples collected at East Tributary for the 2001/2002 Wet season. All samples were dry sieved through a nest of sieves to a value of 4 phi ($63 \mu\text{m}$).

Appendix L Upper Swift Creek cumulative frequency data bed-material load samples for the 2001–2002 wet season

This appendix contains the cumulative percentage values for the bed-material load samples collected at Upper Swift Creek for the 2001/2002 Wet season. All samples were dry sieved through a nest of sieves to a value of 4 phi ($63 \mu\text{m}$).

Appendix M Swift Creek cumulative frequency data bed-material load samples for the 2001–2002 wet season

This appendix contains the cumulative percentage values for the bed-material load samples collected at Swift Creek for the 2001/2002 Wet season. All samples were dry sieved through a nest of sieves to a value of 4 phi ($63 \mu\text{m}$).
