

Submission 3 – Hao Yan Li

I'm a local commercial dragon fruit grower, our industry in Australia is still marked as exotic fruits. Regarding pests, there is almost none registered pesticide and fungicide for us dragon fruit growers to use, hence our produce is very vulnerable to any pest and disease. Once they are there, little to nothing we could do about them. I just want to know if any of quarantine pests are leaked and spread, and there is nothing we can do about them, then what should you do to guarantee it doesn't happen at all?
